

Driveway Repointing Preston, Lancashire

Case Study

This private driveway in the North West of England gets a lot of harsh exposure to de-icing salts from passing traffic and is used for vehicle standing throughout the year, as a result the previous replacement cement pointing was cracked, breaking up and lost in places, also damaging the stone bedding. CR Services were asked for a solution and based on past success they immediately proposed **GftK's vdw 850+ Paving Joint Mortar**.

This unique, epoxy-bound sand paving joint mortar flows easily into the joints and self-compacts, producing a durable solution that is specifically designed to accommodate this kind of heavy exposure and traffic. The other key advantages in the fickle British Summertime weather were that the **vdw 850+** can be applied in wet weather and when rain is forecast, even during the rain, as it is wet-slurry applied, then it hardens rapidly to allow the areas to be put back into service with minimum downtime.
