

Private Residential Perranporth, Cornwall.

Case Study

When this private developer had a new project in Perranporth Cornwall, despite the distance, they wanted the paving works completed by Fisher Builders, as they had used them for quality paving before and were so impressed, they asked them to travel all the way down from their home town of Scarborough in North Yorkshire!!!! This prestige project used medium sized granite flags with narrow 5mm joints to suit the look and function of the steps up to the front door. The problem was what product to use to point / grout these narrow, but critical joints with, especially in this exposed location, with sometime sensitive granite paving surfaces, and in the middle of a cold, wet and windy winter.....?

Fisher referred to NCC streetscape, the flags were first sealed using GftK's vdw 950-3in1-Protect and then the joints were wet-slurry grouted with **GftK's vdw 815 Paving Joint Mortar** - An epoxy bound, graded sand, self-compacting pointing mortar specifically designed for such narrow joints, and which also produces a fast curing, strong, durable finish that is resistant to traffic, weathering and even pressure jet cleaning - unlike most pre-bagged pointing products on the market.

Adrian Fisher said: "From start to finish this product is by far the easiest I have used and provided exactly what we and the client were looking for on this project, plus it will be hard wearing and looks great"
