## Case Study

PJT Maintenance recently completed another natural stone patio and pathway project for a private client in Cheshire; where Managing Director Phil Trick was so taken with the unusual 'Indian Kali' limestone paving stone, that he decided to use it for his own project at home in Buxton.

He was also so impressed with the innovative **GftK** Paving Joint Mortar he had discovered for the Cheshire job, that he also decided to use this again as well.

The **GftK 850** Paving Joint Mortar is a non staining, self compacting, epoxy bound mortar, which allows you to schedule and continue to work whatever the weather – without stopping or waiting when there is a chance of rain and even continuing to work throughout wet weather when necessary.

The work can also all be completed standing up – so no more crawling around on hands and knees, then afterwards there is absolutely no risk of any shrinkage cracking due to variable joint widths or residual water.
