Case Study

G. E. Sharpe & Sons Natural stone paving suppliers are based in Camforth on the Lancashire and Cumbria border. When they redeveloped their display area to show some of their extensive range of different hard landscaping materials and the many different finishes that can be achieved with natural stone, they selected **GftK's Jointing Mortars** as the best paving grouting solutions for the area.

These included **vdw 840plus** a unique polymeric sand jointing mortar that is ideal for natural stone paving on patios, terraces and other domestic pedestrian areas. On the small format natural stone sets that are frequently used for circular driveway designs, they selected the higher performance **vdw 800 Epoxy** bound sand mortar due to its suitability for all types of trafficked areas..

A big plus for **GftK Paving Jointing Mortars** in the UK is that there is no need to wait for a dry weather forecast, because they are slurry applied on pre-wetted paving surfaces, then they self-compact into the joints and finally the surface is brushed off and rinsed again.
