## Case Study

This driveway and terraces surrounding this stunning private residence above the lake, were all designed and installed with a traditional random stretcher pattern of Burlington Stone's Cumbrian Black, natural tumbled stone sets. The paving was all jointed and pointed in a single operation using **GftK's vdw 850** paving joint mortar, in a contrasting stone grey colour, provided by **NCC Streetscape**.

**GftK's vdw 850** paving joint mortar was selected because it is extremely durable and easily able to accommodate the regular 4x4 traffic over the driveway, together with visiting delivery vehicles of up to 20 Tonnes; plus in this exposed location the jointing work had to be completed quickly and on schedule. The rapidly installed **vdw 850** also ensured that access was maintained to the lakeside property, and all without delays due to the cold, wet and damp weather.

**GftK's vdw 850** is 'wet-slurry' applied by squeegee over the pre-dampened stone paving, where it self-compacts into the joints and the surfaces are simply rinsed-off with additional water; therefore it is not necessary to wait for areas to dry out before pointing after wet and rainy weather. No additional compacting is necessary and after a few more minutes, the surface is simply brushed off – job done!
