Case Study

The large, very dirty sandstone patio and cobbled area at this private residence in Northwich was badly in need of refurbishment. The jointing mortar was cracked and failing and there was an extensive amount of difficult to remove, lichen 'black spots' in the surface pores of the slabs, completely spoiling the appearance of this once attractive area.

GftK's vdw 850+ is a tough, non-staining, 2-part epoxy paving mortar, supplied in the UK by NCC Streetscape, which was recommended by specialist contractor CR Services as the ideal solution for this large project, with the patio covering more than 235m².

After remedial works to remove the old jointing, the paving was jet-washed and then the surfaces treated with NCC Black Spot and Green Growth Remover, which brought the natural stone back to its original beauty.

Although it was raining at the time booked for the job, this was no problem when using GftK's vdw 850+, as it is applied by wet-slurry techniques from a standing position. meaning that during application, the wetter, the better! The material effectively self-compacts into the joints, without additional tooling, and then hardens, even if the wet weather continues! In fact, despite the inclement weather, the whole project was completed in a week!
