Case Study

The paving contractor, Jay Merriman, of 'Hit the Bricks Landscaping', who were retained to grout these new sandstone patios and pathways at this property in Tamworth, had never used GftK grouting products before, but having heard favourable reports, were keen to give them a go! He contacted material consultants and distributors, NCC Streetscape, who not only advised that GftK 850plus was the ideal product to complete the job, but also supplied video training and lots of handy tips to ensure success.

GftK vdw 850plus is an extremely durable, 2-part epoxy based jointing mortar, that is applied by wet-slurry techniques and effectively self-compacts into the joints without additional tooling, from a standing position, and with no waiting times, which makes it quick and efficient. A big advantage of GftK vdw 850plus to the contractor, is that it can be applied in wet and cold conditions, so no waiting around, ideal in the unpredictable British weather.

On completing the project, Jay Marriman described GftK vdw 850plus as 'fantastic', a pleasure to use, and hassle free with no nasty surprises. He was delighted with the help and service from NCC Streetscape and will "definitely be using GftK grouting products in the future".

The homeowner was 'over the moon' with the result, safe in the knowledge that just a regular jetwash would keep her patios and paths in pristine condition for years to come.
