Case Study

The pointing in their granite paving had broken down for the second time in less than 5 years, on the large patios and pathways at this home, which overlooks Loch Doon in Scotland. This time the owners were adamant that they needed a tough and reliable jointing solution for repointing in this beautiful, but very exposed location. Also, in this remote area, there are no local specialist contractors, and as competent DIY'ers, the owners wanted a product to successfully install and complete this large project themselves. Through researching on Google and social media, they found very positive reviews for repointing with GftK vdw 850 plus from NCC Streetscape and contacted them to discuss their project. NCC agreed this was the only product that would cope with being applied during the ever-changing and frequently wet Scottish weather and then harden to provide a durable long-term solution. NCC Streetscape not only provided detailed application guidance and videos, but the Technical Services Team also supported them on site to show how easy the GftK vdw 850 plus is to apply.

GftK vdw 850 plus is a unique material, an extremely tough and durable, 2-component, 2nd-generation epoxy resin based jointing mortar, that is applied by wet-slurry techniques. It effectively self-compacts into the joints, with no additional tooling and finishing required. Another big advantage of GftK vdw 850 plus, particularly in this location, is that it can be applied in the wet, even in the rain, so no waiting around for good weather.
