

New Marshalls Infinia Driveway, East Yorkshire

Case Study

Following a strong recommendation from another quality landscaper for GftK paving jointing products, the owner of CJ Paving was inspired to try the products for himself. 'Seeing is Believing' as NCC Streetscape often say in their social media posts!

The owner was unhappy with the different jointing products they had tried from other suppliers, for reasons such as their limitations for use in wet weather, and the time required for cleaning surfaces after grouting, so he contacted NCC Streetscape for a better solution. They advised him that GftK vdw 850 plus would be ideal for jointing most paving projects. This is a unique, high performance, non-staining, 2-part epoxy resin-based paving joint mortar, that can even be applied in the rain. CJ Paving elected to use GftK vdw 815 plus (finer grade for narrow joints < 3mm) for grouting this new 116m² driveway with Marshalls Infinia blocks, which are produced with a sealed, slip resistant, and colour stable finish. GftK vdw 815 plus is quickly and easily applied by wet slurry techniques, working from a standing position, and it can be applied in wet weather, a real bonus, with no waiting around when rain is forecast.

CJ Paving and their customer, the homeowner, were delighted with the results, and CJ paving are now fully confident in using GftK vdw 850 plus on their future paving projects. Additional bonuses for the homeowner, are that with this tough and durable material, there will be no unsightly weed growth in the joints, and they can safely jet-wash their paving to keep it in pristine condition for many years into the future.
