Case Study

This substantial natural Yorkstone driveway in Nantwich, together with a patio and pathways, was looking extremely tired with the original sand and cement grouting cracking, and in some areas coming out completely leaving unsightly gaps. The homeowners did considerable on-line research to find a tough and durable replacement paving joint system that would also be capable of withstanding the continual movements of the family's vehicles.

Following their research, they decided upon Gftk's vdw 850+, a high performance non-staining 2-part epoxy paving mortar from NCC Streetscape, which is extremely tough and durable and ideal for use in driveways. It is applied by wet slurry techniques, (so it can be applied in wet weather), in a comfortable standing position, effectively self compacting into the joints with no additional tooling, making the whole operation both quick and clean.

The crew from specialist paving contractors, CR Services, raked out the old failed jointing and all areas were jet-washed and cleaned using NCC Black Spot & Green Growth Remover, which removes any unsightly green staining and hard to remove lichen deposits.

The homeowners were delighted with their finished patio and in particular the driveway, which can now be used without fear of any damage being inflicted by their cars.
